

Compliance to the Payment Card Industry Data Security Standard (PCI-DSS) Version 1.1 requires that all web facing applications are protected using an application layer firewall. The industry is rife with examples of breaches to web applications and attacks on web applications are ever increasing. In this day and age, it is imperative for organizations to protect their web applications. A Web Application Firewall (WAF) such as the AppSentinel firewall provides protection, control over malicious attacks and compliance to PCI. AppSentinel uses a modular approach to provide the much needed protection.

“ AppSentinel can help you attain compliance to PCI ”

AppSentinel Salient Features

1. **Intrusion Detection** – Proactively identifies and detects web attacks using attack pattern signature matching.
2. **Defender** – Protects against common web application threats.
3. **Inspector** – Robust and deep HTTP inspection mechanism that is fully configurable.
4. **Robust Logging** - Logs all requests based on criteria that are easy to configure and manage.
5. **Centralized Management** – Easy to configure and manage the AppSentinel WAF in a centralized manner.
6. **Policy Management** – Allows you to manage corporate policies across a single or many web applications.
7. **Dashboard Reporting** – Easy to read reports from a dashboard for various audience groups.

“ 7 out of 10 websites are vulnerable to various application layer attack vectors. ”

- Gartner

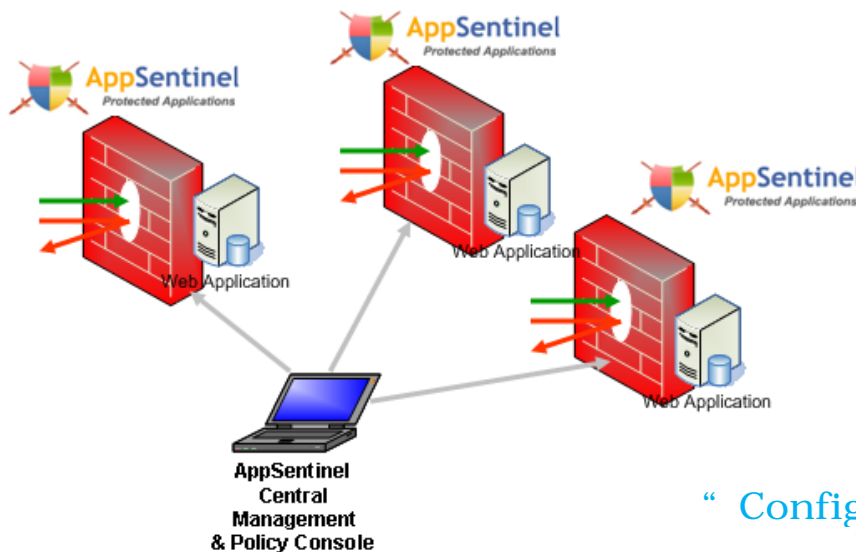

Deployment and Management

The AppSentinel Web Application Firewall can be deployed on web servers running one or many web applications. It has its own service oriented architecture (SOA) web services interfaces that you can use to configure and manage the modules that ships with it. These modules can be selected as per your corporate requirement. Management and configuration of these modules is easy and very intuitive. You can protect, monitor and configure the WAF to address your strategies and compliance needs from a central location.

“ Centralized Corporate Policy Management ”

Rules Management

AppSentinel seamlessly integrates with your web server. Configuring and maintaining rules have never been easier. You can add rules as needed on an adhoc basis without having to restart the web server.

“ Configuring and Managing Rules has never been this easy ! ”

Integration Possibilities

AppSentinel can integrate with various components so that detected vulnerabilities can be mitigated.

Some integration scenarios are listed below.

1. Import vulnerability reports created by commercial products and configure rules automatically.
2. Run source analysis module and protect possible entry points.
3. Developers can define rules for all parameters which can be applied as part of application security policy.
